

Package ‘sveval’

November 9, 2019

Title SV evaluation

Version 1.2.2

Description Evaluate SV in a call set against a truth set using overlap-based approaches and sequence comparison for insertions.

Depends R (\geq 3.4.4)

sveval-package	<i>SV evaluation</i>
----------------	----------------------

Description

Evaluate SV in a call set against a truth set using overlap-based approaches and sequence comparison for insertions.

Details

```

Package:  sveval
Type:     Package
Version:  1.2.2
Date:     2019-09-16
License:  MIT

```

Author(s)

Jean Monlong <jmonlong@ucsc.edu>

See Also

<http://www.github.com/jmonlong/sveval>

Examples

```

## Not run:
eval = svevalOl('calls.vcf', 'truth.vcf')
plot_prcurve(eval$curve)

# Comparing multiple methods
eval.1 = svevalOl('calls1.vcf', 'truth.vcf')
eval.2 = svevalOl('calls2.vcf', 'truth.vcf')
plot_prcurve(list(eval.1$curve, eval.2$curve), labels=c('method1', 'method2'))

```

```
## End(Not run)
```

filterSVs	<i>Filter SVs for size and regions of interest</i>
-----------	--

Description

Filter SVs for size and regions of interest

Usage

```
filterSVs(sv.gr, regions.gr = NULL, ol.prop = 0.5, min.size = 0,  
          max.size = Inf)
```

Arguments

sv.gr	the input SVs (e.g. read from readSVvcf)
regions.gr	the regions of interest. Ignored if NULL (default).
ol.prop	minimum proportion of sv.gr that must overlap regions.gr. Default is 0.5
min.size	the minimum SV size to be considered. Default 0.
max.size	the maximum SV size to be considered. Default is Inf.

Value

a subset of sv.gr that overlaps regions.gr or in the specified size range.

Author(s)

Jean Monlong

findNocalls	<i>Find no-calls variants</i>
-------------	-------------------------------

Description

Compare calls with a truth set and identifies which variants from the truth set specifically not called (genotype ./.).

Usage

```
findNocalls(calls.gr, truth.gr, max.ins.dist = 20, min.cov = 0.5,  
            min.del.rol = 0.1, ins.seq.comp = FALSE, nb.cores = 1,  
            sample.name = NULL, check.inv = FALSE)
```

Arguments

<code>calls.gr</code>	call set. A GRanges or the path to a VCF file.
<code>truth.gr</code>	truth set. A GRanges or the path to a VCF file.
<code>max.ins.dist</code>	maximum distance for insertions to be clustered. Default is 20.
<code>min.cov</code>	the minimum coverage to be considered a match. Default is 0.5
<code>min.del.rol</code>	minimum reciprocal overlap for deletions. Default is 0.1
<code>ins.seq.comp</code>	compare sequence instead of insertion sizes. Default is FALSE.
<code>nb.cores</code>	number of processors to use. Default is 1.
<code>sample.name</code>	the name of the sample to use if VCF files given as input. If NULL (default), use first sample.
<code>check.inv</code>	should the sequence of MNV be compared to identify inversions.

Details

Same overlapping strategy as in `sveval01` although here no-calls are kept and there is no splitting by genotype.

Value

a data.frame with coordinates and variant ids from the truth set corresponding to no-calls.

Author(s)

Jean Monlong

<code>freqAnnotate</code>	<i>Annotate SVs with frequency in catalog</i>
---------------------------	---

Description

Annotate SVs with frequency in catalog

Usage

```
freqAnnotate(svs, cat, min.cov = 0.5, min.del.rol = 0.1,
  max.ins.dist = 20, ins.seq.comp = FALSE, out.vcf = NULL,
  freq.field = "AF", out.freq.field = "AFMAX")
```

Arguments

<code>svs</code>	a VCF object with SVs to annotate.
<code>cat</code>	a VCF object with the SV catalog with frequency estimates.
<code>min.cov</code>	the minimum coverage to be considered a match. Default is 0.5
<code>min.del.rol</code>	minimum reciprocal overlap for deletions. Default is 0.1
<code>max.ins.dist</code>	maximum distance for insertions to be clustered. Default is 20.
<code>ins.seq.comp</code>	compare sequence instead of insertion sizes. Default is FALSE.
<code>out.vcf</code>	If non-NULL, write output to this VCF file.
<code>freq.field</code>	the field with the frequency estimate in the 'cat' input. Default is 'AF'.
<code>out.freq.field</code>	the new field's name. Default is 'AFMAX'

Value

a GRanges object.

Author(s)

Jean Monlong

Examples

```
## Not run:
## From VCF files with output written to VCF file
freqAnnotate('calls.vcf', 'gnomad.vcf', out.vcf='calls.withFreq.vcf')

## Within R
calls.vcf = readSVvcf('calls.vcf', vcf.object=TRUE)
cat.vcf = readSVvcf('gnomad.vcf', vcf.object=TRUE)
calls.freq.vcf = freqAnnotate(calls.vcf, cat.vcf)

## End(Not run)
```

ivg_sv

Interactive exploration of SVs in a variation graph

Description

Opens a Shiny app with a dynamic table that contains input SVs. Clicking on a SV (row in the table) generates a simplified representation of the variation graph around this SV. The number of flanking nodes (context) can be increased if necessary, e.g. for large insertions. vg needs to be installed (<https://github.com/vgteam/vg>).

Usage

```
ivg_sv(svs, xg, ucsc.genome = "hg38")
```

Arguments

<code>svs</code>	either a GRanges with SVs (e.g. from <code>readSVvcf</code>) or the path to a VCF file.
<code>xg</code>	the path to the xg object of the variation graph.
<code>ucsc.genome</code>	the genome version for the UCSC Genome Browser automated link.

Value

Starts a Shiny app in a web browser.

Author(s)

Jean Monlong

<code>plot_perregion</code>	<i>Recall, precision, F1 per region</i>
-----------------------------	---

Description

Recall, precision, F1 per region

Usage

```
plot_perregion(eval, regions.gr, min.region.ol = 0.5, plot = TRUE)
```

Arguments

<code>eval</code>	the output of <code>sveval01</code> .
<code>regions.gr</code>	GRanges object with regions of interest
<code>min.region.ol</code>	minimum proportion of variant that must overlap regions.gr. Default is 0.5
<code>plot</code>	should the function return the plot list. Default is TRUE. If FALSE, returns a data.frame.

Value

a list of ggplot objects if `plot=TRUE` (default); a data.frame otherwise.

Author(s)

Jean Monlong

plot_persize	<i>Recall, precision, F1 per SV size</i>
--------------	--

Description

Recall, precision, F1 per SV size

Usage

```
plot_persize(eval, size.breaks = c(50, 100, 500, 1000, 10000, Inf),
  plot = TRUE)
```

Arguments

eval	the output of sveval01.
size.breaks	a vector for breaking the sizes into classes.
plot	should the function return the plot list. Default is TRUE. If FALSE, returns a data.frame.

Value

a list of ggplot objects if plot=TRUE (default); a data.frame otherwise.

Author(s)

Jean Monlong

plot_prcurve	<i>Create precision-recall graphs</i>
--------------	---------------------------------------

Description

Create a precision/recall curve using metrics computed by the sveval01 function. The sveval01 function returns a list containing a "curve" data.frame with the evaluation metrics for different quality thresholds.

Usage

```
plot_prcurve(eval, labels = NULL)
```

Arguments

eval	a data.frame, a list of data.frames, or a vector with one or several paths to files with "curve" information.
labels	the labels to use for each input (when multiple inputs are used). Ignored is NULL (default).

Details

If the input is a data.frame (or list of data.frames) it should be the "curve" element of the list returned by the `sveval01` function. If the input is a character (or a vector of characters), they are considered to be file names and the data will be read from these files.

If multiple inputs are given, either using a list of data.frames or a vectors with several filenames, one curve per input will be created. This is to be used to quickly compare several methods. The "labels" parameters can be used to specify a label for each input to use for the graphs.

Value

list of ggplot graph objects

Author(s)

Jean Monlong

Examples

```
## Not run:
eval = sveval01('calls.vcf', 'truth.vcf')
plot_prcurve(eval$curve)

# Comparing multiple methods
eval.1 = sveval01('calls1.vcf', 'truth.vcf')
eval.2 = sveval01('calls2.vcf', 'truth.vcf')
plot_prcurve(list(eval.1$curve, eval.2$curve), labels=c('method1', 'method2'))

# Or if the results were previously written in files
plot_prcurve(c('methods1-prcurve.tsv', 'methods2-prcurve.tsv'), labels=c('method1', 'method2'))

## End(Not run)
```

prf

Compute precision, recall and F1 score

Description

Compute the precision, recall and F1 score using the TP, TP.baseline, FP and FN columns.

Usage

```
prf(eval.df)
```

Arguments

`eval.df` a data.frame with columns TP, TP.baseline, FP, and FN.

Value

the input data.frame with 3 new columns precision, recall and F1.

Author(s)

Jean Monlong

readSVvcf	<i>Read SVs from a VCF file</i>
-----------	---------------------------------

Description

Read a VCF file that contains SVs and create a GRanges with relevant information, e.g. SV size or genotype quality.

Usage

```
readSVvcf(vcf.file, keep.ins.seq = FALSE, keep.ref.seq = FALSE,
  sample.name = NULL, qual.field = c("GQ", "QUAL"),
  check.inv = FALSE, keep.ids = FALSE, nocalls = FALSE,
  right.trim = TRUE, vcf.object = FALSE)
```

Arguments

<code>vcf.file</code>	the path to the VCF file
<code>keep.ins.seq</code>	should it keep the inserted sequence? Default is FALSE.
<code>keep.ref.seq</code>	should it keep the reference allele sequence? Default is FALSE.
<code>sample.name</code>	the name of the sample to use. If NULL (default), use first sample.
<code>qual.field</code>	fields to use as quality. Will be tried in order.
<code>check.inv</code>	should the sequence of MNV be compared to identify inversions.
<code>keep.ids</code>	keep variant ids? Default is FALSE.
<code>nocalls</code>	if TRUE returns no-calls only (genotype ./.). Default FALSE.
<code>right.trim</code>	if TRUE (default) the REF/ALT sequences are right-trimmed after splitting up multi-ALT variants.
<code>vcf.object</code>	should the output be a VCF object instead. Default is FALSE.

Details

By default, the quality information is taken from the QUAL field. If all values are NA or 0, the function will try other fields as specified in the "qual.field" vector. Fields can be from the INFO or FORMAT fields.

Value

a GRanges object with relevant information.

Author(s)

Jean Monlong

Examples

```
## Not run:
calls.gr = readSVvcf('calls.vcf')

## End(Not run)
```

rmskAnnotate

Annotate REF/ALT sequence with RepeatMasker

Description

Extracts REF/ALT sequence from a VCF, runs RepeatMasker to annotate transposable elements and simple repeats, and annotates the original variants.

Usage

```
rmskAnnotate(svs.gr, nb.cores = 1, species = "human",
             docker.image = NULL)
```

Arguments

<code>svs.gr</code>	SVs. A GRanges or the path to a VCF file.
<code>nb.cores</code>	the number of cores that RepeatMasker should use. Default:1.
<code>species</code>	the species to use in RepeatMasker. Default: human.
<code>docker.image</code>	docker image with RepeatMasker. Default is NULL.

Details

This is a simple annotation where only the main repeat class is retrieved for each variant (covering most of the sequence).

RepeatMasker must be installed.

Value

an updated GRanges with new columns 'rmsk.name', 'rmsk.classfam' and 'rmsk.cov'.

Author(s)

Jean Monlong

Examples

```
## Not run:
svs.gr = readSVvcf('calls.vcf', keep.ins.seq=TRUE, keep.ref.seq=TRUE)
svs.gr = rmskAnnotate(svs.gr)

## End(Not run)
```

sveval0l

SV evaluation based on overlap and variant size

Description

SV evaluation based on overlap and variant size

Usage

```
sveval0l(calls.gr, truth.gr, max.ins.dist = 20, min.cov = 0.5,
min.del.rol = 0.1, ins.seq.comp = FALSE, nb.cores = 1,
min.size = 50, max.size = Inf, bed.regions = NULL,
bed.regions.ol = 0.5, qual.field = c("QUAL", "GQ"),
sample.name = NULL, outfile = NULL, out.bed.prefix = NULL,
qual.ths = c(0, 2, 3, 4, 5, 7, 10, 12, 14, 21, 27, 35, 45, 50, 60, 75,
90, 99, 110, 133, 167, 180, 250, 350, 450, 550, 650),
qual.quantiles = seq(0, 1, 0.1), check.inv = FALSE,
geno.eval = FALSE, stitch.hets = FALSE, stitch.dist = 20,
merge.hets = FALSE, merge.rol = 0.8)
```

Arguments

<code>calls.gr</code>	call set. A GRanges or the path to a VCF file.
<code>truth.gr</code>	truth set. A GRanges or the path to a VCF file.
<code>max.ins.dist</code>	maximum distance for insertions to be clustered. Default is 20.
<code>min.cov</code>	the minimum coverage to be considered a match. Default is 0.5
<code>min.del.rol</code>	minimum reciprocal overlap for deletions. Default is 0.1
<code>ins.seq.comp</code>	compare sequence instead of insertion sizes. Default is FALSE.
<code>nb.cores</code>	number of processors to use. Default is 1.
<code>min.size</code>	the minimum SV size to be considered. Default 50.
<code>max.size</code>	the maximum SV size to be considered. Default is Inf.
<code>bed.regions</code>	If non-NULL, a GRanges object or path to a BED file (no headers) with regions of interest.
<code>bed.regions.ol</code>	minimum proportion of sv.gr that must overlap regions.gr. Default is 0.5
<code>qual.field</code>	fields to use as quality. Will be tried in order.
<code>sample.name</code>	the name of the sample to use if VCF files given as input. If NULL (default), use first sample.

<code>outfile</code>	the TSV file to output the results. If NULL (default), returns a data.frame.
<code>out.bed.prefix</code>	prefix for the output BED files. If NULL (default), no BED output.
<code>qual.ths</code>	the QUAL thresholds for the PR curve. If NULL, will use quantiles. see <code>qual.quantiles</code> .
<code>qual.quantiles</code>	the QUAL quantiles for the PR curve, if <code>qual.ths</code> is NULL. Default is (0, .1, ..., .9, 1).
<code>check.inv</code>	should the sequence of MNV be compared to identify inversions.
<code>geno.eval</code>	should het/hom be evaluated separately (genotype evaluation). Default FALSE.
<code>stitch.hets</code>	should clustered hets be stitched together before genotype evaluation. Default is FALSE.
<code>stitch.dist</code>	the maximum distance to stitch hets during genotype evaluation.
<code>merge.hets</code>	should similar hets be merged into homs before genotype evaluation. Default is FALSE.
<code>merge.rol</code>	the minimum reciprocal overlap to merge hets before genotype evaluation.

Value

a list with

<code>eval</code>	a data.frame with TP, FP and FN for each SV type when including all variants
<code>curve</code>	a data.frame with TP, FP and FN for each SV type when using different quality thresholds
<code>svs</code>	a list of GRanges object with FP, TP and FN for each SV type (when using $QUAL_i=0$ threshold).

Author(s)

Jean Monlong

Examples

```
## Not run:
## From VCF files
eval = sveval01('calls.vcf', 'truth.vcf')

## From GRanges
calls.gr = readSVvcf('calls.vcf')
truth.gr = readSVvcf('truth.vcf')
eval = sveval01(calls.gr, truth.gr)

## Genotype evaluation
eval = sveval01(calls.gr, truth.gr, geno.eval=TRUE, merge.hets=TRUE, stitch.hets=TRUE)

## End(Not run)
```

svOverlap*Overlap and annotate SV sets with coverage metrics*

Description

Overlap and annotate SV sets with coverage metrics

Usage

```
svOverlap(query, subject, max.ins.dist = 20, min.cov = 0.5,  
          min.del.rol = 0.1, ins.seq.comp = FALSE, nb.cores = 1)
```

Arguments

query	a GRanges object with SVs
subject	another GRanges object with SVs
max.ins.dist	maximum distance for insertions to be clustered. Default is 20.
min.cov	the minimum coverage to be considered a match. Default is 0.5
min.del.rol	minimum reciprocal overlap for deletions. Default is 0.1
ins.seq.comp	compare sequence instead of insertion sizes. Default is FALSE.
nb.cores	number of processors to use. Default is 1.

Value

a list with:

query	the query GRanges object annotated
subject	the subject GRanges object annotated
